

The Cambodiana Mango (S.P.I. No. 8701.)

This variety which was discovered by Mr. David Fairchild in Saigon, Cochin China, in 1902 and introduced in the form of seeds has produced some valuable seedling trees. The fruit represented is from a seedling at the Mayaguez Experiment Station in Porto Rico. Seedlings of the Cambodiana which come reasonably true to type have proven to be early and remarkably sure croppers in Porto Rico, the Isle of Pines, and South Florida. The fruit has its own characteristic flavor which is preferred by some to that of the Indian varieties. It is fiberless, of a golden yellow color, and by many growers is considered a commercial variety because of its regular fruiting habit. It is subject to the attacks of the mango fruit fly in Porto Rico. Natural size photograph, No. 16011, taken by Wilson Popenoe, at Mayaguez, Porto Rico, July 6, 1914.
